i played with it for about 45 min this morning. it's quite easy to
crash, even hard hang that requires a power cycle. lots of "uae's.
still has a long way to go stability wise. though they have clearly
made a lot of progress since the last drop we had. the workplace
shell is usable and win apps do run, mostly. easy to run out of
memory doing simple things, and it was on a 9M machine.

one nice thing is that way to config a dos vm. i'll make sure the dos
guys have a look.

it's running in chrissh's perf lab. check it out. the nice thing
is the way the let you config a dos vm, essentially managing the
config.sys in a dialog box.
